

Shares and Dividend

3.1 Introduction:

To establish a big company, a large sum of money is required. It is sometimes not possible for an individual to invest such a big amount. Then some persons, interested in the company, join together. They divide the estimated value into small parts ranging from $\overline{\xi}$ 1 to $\overline{\xi}$ 100. Each part so obtained is called a **share** and the value fixed for each share is called its **original** or **nominal value** (N.V.). The persons who purchase shares are called **share-holders**.

- 1. The nominal value (N.V.) of a share is also called its Register value, Printed value, Face value (F.V.), etc. The nominal value of a share does not change with time.
- 2. The price of a share in the market, at any particular time, is called its *Market value* (M.V.) or *cash value*. The market value of a share may change (decrease or increase) with time.
- 3. The *market value* of a share can be the same, more or less than the *nominal value* of the share depending upon the performance and profits of the company.
 - (i) If the market value of a share is the same as its nominal value, the share is said to be at par.
 - (ii) If the market value of a share is more than its nominal value, the share is said to be above par or at a premium.
 - (iii) If the market value of a share is less than its nominal value, the share is said to be below par or at a discount.
 - Thus, (i) At par means: Market value = Nominal value i.e. M.V. = N.V.
 - (ii) Above par or at a premium means: M.V. > N.V.
 - (iii) Below par or at a discount means: M.V. < N.V.
- 4. The *profit*, which a *share-holder* gets (out of the profits of the company) from his investment in the company, is called *dividend*.
 - (i) The dividend is always expressed as a percentage of the nominal value of the share.
 - (ii) The dividend does not depend on the market value of the share.

3.2 Formulae :

1. Sum invested = No. of shares bought \times M.V. of 1 share.

If the shares are available at par

 \Rightarrow M.V. of each share = N.V. of it

2. No. of shares bought = $\frac{\text{Sum invested to buy the shares}}{\text{Sum invested to buy the shares}}$

M.V.of 1 share

Also, no. of shares bought = $\frac{\text{Total dividend from these shares}}{\text{Total dividend from these shares}}$

Dividend on 1 share

Total income (profit)

Income (profit) on 1 share

21

- 3. Total dividend earned = No. of shares \times rate of dividend \times N.V. of a share
- 4. Return % = Income (profit) % $= \frac{\text{Income}}{\text{Investment}} \times 100\%$
- 5. For a share holder:

Income = Return = Profit = Dividend paid by the company

- 1 Calculate the money required to buy:
 - (i) 350, ₹ 20 shares at a premium of ₹ 7.
 - (ii) 275, ₹ 60 shares at a discount of ₹ 10.
 - (iii) 50, ₹ 40 shares quoted at ₹ 38.50.

Solution:

- (i) No. of shares to be bought = 350
- ₹ 20 shares at a premium of ₹ 7 means; nominal value of the share is ₹ 20 and its market value = ₹ 20 + ₹ 7 = ₹ 27.
 - ∴ Money required to buy 1 share = ₹27
 - ⇒ Money required to buy 350 shares = $350 \times ₹ 27 = ₹ 9,450$ Ans.
- (ii) Money required to buy 1 share = 3000 + 1000 = 3000 = 3000
 - ⇒ Money required to buy 275 shares = $275 \times ₹ 50 = ₹ 13,750$ Ans.
- (iii) Quoted price of a share means its market value.
 - ∴ Money required to buy 1 share = ₹ 38.50
 - ⇒ Money required to buy 50 shares = $50 \times ₹ 38.50 = ₹ 1,925$ Ans.
 - Rakhee invested ₹ 12,500 in shares of a company paying 6% dividend per annum. If she bought ₹ 50 shares for ₹ 62.50 each, find her income from the investment.

Solution:

Since, the market value of each share = ₹ 62.50 and the sum invested is ₹ 12,500

$$\therefore$$
 No. of shares bought by Rakhee = $\frac{12,500}{62.50}$ = 200

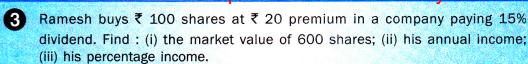

No. of shares bought =
$$\frac{\text{Sum invested}}{\text{M.V. of 1 share}}$$

Income (dividend) on one share = 6% of N.V. =
$$\frac{6}{100}$$
 × ₹ 50 = ₹ 3

Therefore, her total income =
$$200 \times \cente{7} 3 = \cente{7} 600$$
 Ans.

or, directly:

Income = No. of shares × Rate of div. × Face value (N.V.) of each share =
$$200 \times 6\% \times ₹50 = ₹600$$
 Ans.

Solution:

- (i) Market value of 1 share = ₹ 100 + ₹ 20 = ₹ 120 \Rightarrow Market value of 600 shares = $600 \times ₹ 120 = ₹ 72,000$ Ans.
- (ii) Annual income = No. of shares × Rate of div. × N.V. (F.V.) of 1 share = $600 \times \frac{15}{100} \times 7000 \times 9000$ Ans.
- (iii) ₹ 9,000 is the income obtained on investing ₹ 72,000

:. Percentage income =
$$\frac{9,000}{72,000} \times 100\% = 12.5\%$$
 Ans.

Income % on M.V. = Dividend % on N.V. $\Rightarrow \qquad \text{Income } \% \times 120 = 15\% \times 100$ $\Rightarrow \qquad \text{Income } \% = \frac{15\% \times 100}{120} = 12.5\%$

Solution:

and M.V. of each share = ₹ 120

∴ No. of shares bought =
$$\frac{\text{₹}67,200}{\text{₹}120}$$
 = 560

Given : dividend (income) on 1 share = 12% of N.V.

.. Total income from the shares =
$$560 \times ₹ 12 = ₹ 6,720$$

Ans.

Solution:

- : Half-yearly dividend on 1 share = 4% of ₹ 50
- ⇒ The yearly dividend on 1 share = 8% of ₹ 50 = $\frac{8}{100}$ × ₹ 50 = ₹ 4
- ⇒ Total dividend due at the end of the year = $250 \times ₹ 4 = ₹ 1,000$. Ans.

Downloaded from https://www.studiestoday.com

6 A man bought 500 shares, each of face value ₹ 10, of a certain business concern and during the first year, after purchase, receives ₹ 400 as dividend on his shares. Find the rate of dividend on the shares.

Solution:

and the number of shares bought
$$= 500$$

∴ Total sum invested in shares =
$$500 \times ₹ 10 = ₹ 5,000$$

∴ Rate of dividend =
$$\frac{\text{Dividend}}{\text{Sum invested}} \times 100\%$$

$$= \frac{7400}{5000} \times 100\% = 8\%$$

Ans.

Mukul invests ₹ 9,000 in a company paying a dividend of 6% per annum when a share of face value ₹ 100 stands at ₹ 150. What is his annual income ? If he sells 50% of his shares at ₹ 200 each, what is his gain in this transaction?

Solution:

⇒ No. of shares bought by Mukul =
$$\frac{₹9,000}{₹150}$$
 = 60

His annual income on 1 share = 6% of N.V. = 6% of ₹
$$100 = ₹ 6$$

⇒ His total annual income =
$$60 \times ₹6$$
 = ₹ 360 Ans.

$$50\%$$
 of shares = 50% of 60 = 30

A man wants to buy 62 shares available at ₹ 132 (par value being ₹ 100).

- (i) How much he will have to invest?
- (ii) If the dividend is 7.5%, what will be his annual income?
- (iii) If he wants to increase his annual income by ₹ 150, how many extra [2002] shares should he buy?

Solution:

(i) He will have to invest =
$$62 \times 7132 = 8,184$$

(ii) Dividend on 1 share =
$$7.5\%$$
 of ₹ 100 = ₹ 7.50

$$\Rightarrow$$
 His annual income = 62 × ₹ 7.50 = ₹ 465

: The man wants to increase his income by ₹ 150 (iii)

and the income on one share
$$= 7.50$$

∴ The no. of extra shares he must buy =
$$\frac{₹150}{₹7.50}$$
 = 20 Ans.

- 9 A company with 4000 shares of nominal value of ₹ 110 each declares an annual divided of 15%. Calculate:
 - (i) the total amount of dividend paid by the company.
 - (ii) the annual income of Shah Rukh who holds 88 shares in the company?
 - (iii) if he received only 10% on his investment, find the price Shah Rukh paid for each share. [2008]

Solution:

(i) Given

number of shares = 4000

nominal value of each share = ₹ 110

and.

dividend = 15%

Total amount of dividend paid by the company

= Dividend on one share x Number of shares

= (15% of ₹ 110) × 4000 = ₹ 66,000

Ans.

(ii) The annual income of Shah Rukh

= Dividend on one share x Number of shares

= (15% of ₹ 110) × 88 = ₹ 1.452

Ans.

(iii) Let Shah Rukh pays $\stackrel{?}{\underset{}}$ x for each share

⇒ For Shah Rukh, M.V. of 1 share = ₹x

Income % on M.V. = Dividend % on N.V.

10% of x = 15% of ₹ 110

x = 165

.. Shah Rukh paid for each share = ₹ 165

Ans.

EXERCISE 3(A)

- 1. How much money will be required to buy 400, ₹ 12.50 shares at a premium of ₹ 1?
- 2. How much money will be required to buy 250, ₹ 15 shares at a discount of ₹ 1.50 ?
- 3. A person buys 120 shares at a nominal value of ₹ 40 each, which he sells at ₹ 42.50 each. Find his profit and profit percent.
- 4. Find the cost of 85 shares of ₹ 60 each when quoted at ₹ 63.25.
- 5. A man invests ₹ 800 in buying ₹ 5 shares and when they are selling at a premium of $\mathbf{\xi}$ 1.15, he sells all the shares. Find his profit and profit percent.
- 6. Find the annual income derived from 125, ₹ 120 shares paying 5% dividend.
- 7. A man invests ₹ 3,072 in a company paying 5 % per annum, when its ₹ 10 share can be

bought for ₹ 16 each. Find:

- (i) his annual income;
- (ii) his percentage income on his investment.
- 8. A man invests ₹ 7,770 in a company paying 5 percent dividend when a share of nominal value of ₹ 100 sells at a premium of ₹ 5. Find:
 - (i) the number of shares bought;
 - (ii) annual income;
 - (iii) percentage income.
- 9. A man buys ₹ 50 shares of a company, paying 12 percent dividend, at a premium of ₹ 10. Find:
 - (i) the market value of 320 shares;
 - (ii) his annual income;
 - (iii) his profit percent.

- 10. A man buys ₹ 75 shares at a discount of ₹ 15 of a company paying 20% dividend. Find:
 - (i) the market value of 120 shares:
 - (ii) his annual income;
 - (iii) his profit percent.
- 11. A man has 300, ₹ 50 shares of a company paying 20% dividend. Find his net income after paying 3% income tax.
- 12. A company pays a dividend of 15% on its tenrupee shares from which it deducts income tax at the rate of 22%. Find the annual income of a man who owns one thousand shares of this company?
- 13. A man invests ₹ 8,800 in buying shares of a company of face value of rupees hundred

- each at a premium of 10%. If he earns ₹ 1,200 at the end of the year as dividend, find:
- (i) the number of shares he has in the company.
- (ii) the dividend percent per share. [2001
- 14. A man invests ₹ 1,680 in buying shares of nominal value ₹ 24 and selling at 12% premium. The dividend on the shares is 15% per annum. Calculate:
 - (i) the number of shares he buys;
 - (ii) the dividend he receives annually.
- 15. By investing ₹ 7,500 in a company paying 10 percent dividend, an annual income of ₹ 500 is received. What price is paid for each of ₹ 100 share?

3.3 Miscellaneous Problems :

A man buys a ₹ 80 share in a company, which pays 20% dividend. He buys the share at such a price that his profit is 16% on his investment. At what price did he buy the share ?

Solution:

Dividend (profit) given by the company on 1 share = 20% of $\stackrel{?}{\stackrel{?}{$\sim}}$ 80 = $\stackrel{?}{\stackrel{?}{$\sim}}$ 16.

Suppose the man buys one share for $\overline{\xi}$ x.

∴ His profit = 16% of ₹
$$x = ₹ \frac{16x}{100}$$

According to the statement, $\frac{16x}{100} = 16 \Rightarrow x = ₹ 100$

: The man buys each share for ₹ 100

Ans.

or, directly:

In this example, N.V. of 1 share = $\stackrel{?}{\stackrel{?}{=}}$ 80, Rate of dividend = 20%, Profit % = 16% and we are required to find M.V.

∴
$$\frac{20}{100} \times 80 = \frac{16}{100} \times \text{M.V.}$$

⇒ $\frac{20}{100} \times 80 = \frac{16}{100} \times 80 \times \frac{100}{16} = ₹ 100$ Ans.

- Ajay owns 560 shares of a company. The face value of each share is ₹ 25.
 The company declares a dividend of 9%. Calculate:
 - (i) the dividend that Ajay will get.
 - (ii) the rate of interest on his investment, if Ajay had paid ₹ 30 for each share. [2007]

(i) Dividend on each share
$$= 9\%$$
 of $\stackrel{?}{\underset{?}{?}} 25 = \stackrel{?}{\underset{?}{?}} \frac{9 \times 25}{100}$
 \Rightarrow Dividend that Ajay will get $=$ Dividend on 560 shares
$$= \stackrel{?}{\underset{?}{?}} \frac{9 \times 25}{100} \times 560 = \stackrel{?}{\underset{?}{?}} 1,260$$
 Ans.

(ii) Let rate of interest on his investment = x%.

Since, Ajay paid ₹ 30 for each share, market value of each share = ₹ 30

We know:

$$\Rightarrow$$
 $x\%$ of ₹ 30 = 9% of ₹ 25

$$\Rightarrow \frac{x}{100} \times 30 = \frac{9}{100} \times 25 \Rightarrow x = 7.5$$

 \therefore The rate of interest = 7.5%

Ans.

How much should a man invest in ₹ 80 shares selling at ₹ 75 to obtain an annual income of ₹ 1,080, if the dividend declared is 15 percent ?

Solution:

(12)

∴ Number of shares bought =
$$\frac{\text{Total dividend}}{\text{Div. on 1 share}} = \frac{₹1,080}{₹12} = 900$$

Since, market value of each share = ₹ 75

∴ Sum invested by the man =
$$900 \times ₹75 = ₹67,500$$
 Ans.

- (i) the market value of the share;
- (ii) the amount to be invested to obtain an annual dividend of ₹ 630. [2000]

Solution:

(i)
$$\therefore$$
 Rate of return \times M.V. = Rate of dividend \times N.V.

$$\Rightarrow \frac{7.5}{100} \times \text{M.V.} = \frac{9}{100} \times ₹ 100 \Rightarrow \text{M.V.} = ₹ 120$$

$$∴ M.V. of a share = ₹ 120 Ans.$$

(ii) : Annual income on 1 share = 9% of
$$\stackrel{?}{\stackrel{?}{?}}$$
 100 = $\stackrel{?}{\stackrel{?}{?}}$ 9

Number of shares bought =
$$\frac{\text{Total annual income}}{\text{Annual income on 1 share}}$$

And, the amount to be invested = No. of shares bought \times M.V. of 1 share

Ans.

Which is a better investment : 12% ₹ 100 shares at 120 or 8% ₹ 100 shares at 90 ?

Solution:

Since, profit% on M.V. = Dividend% on N.V.

In first case:

P% on ₹ 120 = 12% on ₹ 100
⇒
$$\frac{P}{100} \times ₹ 120 = \frac{12}{100} \times ₹ 100 \Rightarrow Profit = 10%$$

And, in second case:

P% on ₹ 90 = 8% on ₹ 100

$$\Rightarrow \frac{P}{100} \times ₹ 90 = \frac{8}{100} \times ₹ 100 \Rightarrow Profit = 8.9\%$$

- ... The investment giving greater profit%, will be better.
 - .. The first investment is better.

Ans.

15 A man sells 60, ₹ 15 shares of a company paying 12 percent dividend, at ₹ 21 each and invests the proceeds in ₹ 6 shares of another company at ₹ 9 each. Find his change in income, if the second company pays a dividend of 8 percent.

Solution:

In the 1st case:

No. of shares = 60, N.V. of 1 share = ₹ 15 and rate of dividend = 12%
∴ Income on 1 share = 12% of ₹ 15 = ₹ 1.80
⇒ Total income =
$$60 \times ₹ 1.80 = ₹ 108$$

Now, he sells all the shares for ₹ 21 each

∴ Money obtained by selling all the 60 shares = $60 \times ₹ 21 = ₹ 1,260$.

In the 2nd case:

Sum invested = ₹ 1,260, N.V. of 1 share = ₹ 6; M.V. of 1 share = ₹ 9
and rate of dividend = 8%

∴ No. of shares bought =
$$\frac{1,260}{9}$$
 = 140
and dividend on 1 share = 8% of ₹ 6 = ₹ 0.48

⇒ Total income = 140 × ₹ 0.48 = ₹ 67.20
∴ Change (decrease) in income = ₹ 108 - ₹ 67.20

= ₹ 40.80

Mr. Ram Gopal invested ₹ 8,000 in 7% ₹ 100 shares at ₹ 80. After a year, he sold these shares at ₹ 75 each and invested the proceeds (including his dividend) in 18%, ₹ 25 shares at ₹ 41. Find :

- (i) his dividend for the first year
- (ii) his annual income in the second year
- (iii) the percentage increase in his return on his original investment. [2006]

Solution:

Given: investment = ₹ 8,000, div. % = 7%, N.V. = ₹ 100 and M.V. = ₹ 80

(i) No. of shares =
$$\frac{\text{Investment}}{\text{M.V. of each share}} = \frac{\text{₹ 8,000}}{\text{₹ 80}} = 100$$

$$\therefore \qquad \text{Div. on 1 share } = 7\% \text{ of } ? 100 = ? 7$$

∴ His dividend for the first year =
$$₹ 7 \times 100 = ₹ 700$$
 Ans.

(ii) Since, each share is sold for ₹ 75

∴ The proceeds (including dividend) =
$$100 \times ₹75 + ₹700 = ₹8,200$$

∴ No. of shares bought =
$$\frac{₹8,200}{₹41}$$
 = 200
Div. on 1 share = 18% of ₹25

$$= \frac{18}{100} \times ₹ 25 = ₹ 4.50$$

:. Annual dividend (income) in the second year

Ans.

Percentage increase in return (on the original investment)

=
$$\frac{₹200}{₹8,000}$$
 × 100% = 2.5% Ans.

17 Ashok and Sandeep invest ₹ 18,000 each in buying shares of two different companies. Ashok buys 7.5% ₹ 100 shares at a discount of 20%, whereas Sandeep buys ₹ 50 shares at a premium of 20%. If both receive equal dividend at the end of the year, find the rate of dividend received by Sandeep.

Solution:

For Ashok

$$\therefore \qquad \text{Number of shares bought} = \frac{₹18,000}{₹80} = 225$$

Dividend on 1 share = 7.5% of $\stackrel{?}{\sim} 100 = \stackrel{?}{\sim} 7.50$

∴ Total dividend received = $225 \times ₹7.50 = ₹1687.50$

For Sandeep

N.V. of each share
$$= 750$$

∴ Number of shares bought =
$$\frac{₹18,000}{₹60}$$
 = 300

Now, we have two methods of finding the rate of dividend.

First method:

It is given that Ashok and Sandeep receive equal dividend.

and, dividend on each share
$$=\frac{₹1687.50}{300} = ₹\frac{45}{8}$$

$$\Rightarrow \qquad \qquad \text{On ₹ 50, dividend } = ₹ \frac{45}{8}$$

$$\Rightarrow \qquad \qquad \textbf{Rate of dividend} = \frac{45}{8 \times 50} \times 100\% = 11.25\% \qquad \textbf{Ans.}$$

Second Method:

Let the rate of dividend received by Sandeep = x%

⇒ Dividend on each share =
$$x\%$$
 of ₹ 50

$$= \frac{x}{100} \times ₹50 = ₹\frac{x}{2}$$

⇒ Dividend on 300 shares =
$$300 \times ₹\frac{x}{2} = ₹150 x$$

Since, dividend received by both is the same

∴
$$₹ 150 x = ₹ 1687.50$$

$$\Rightarrow \qquad x = \frac{1687.50}{150} = 11.25$$

Ans.

John had 1,000 shares of a company with a face value of ₹ 40 and paying 8% dividend. He sold some of these shares at a discount of 10% and invested the proceeds in ₹ 20 shares at a premium of 50% and paying 12% dividend. If the change in his income is ₹ 192, find the number of shares sold by John.

Let the number of shares sold by John be x.

In the first case:

: N.V. of each share = ₹ 40

and rate of dividend = 8%

∴ Dividend on each share = 8% of ₹ 40 = ₹ 3.20

and, dividend on x shares = 3.20 x

He sold each share for ₹ 40 - 10% of ₹ 40 i.e. for ₹ 36

⇒ Money obtained by selling x shares = ₹ 36 x

In second case:

Sum invested =
$$\mathbf{\xi}$$
 36 x

M.V. of each share =
$$\stackrel{?}{\stackrel{?}{\stackrel{?}{\sim}}} 20 + 50\%$$
 of $\stackrel{?}{\stackrel{?}{\stackrel{?}{\stackrel{?}{\sim}}}} 20 = \stackrel{?}{\stackrel{?}{\stackrel{?}{\stackrel{?}{\sim}}}} 30$

$$\therefore \qquad \text{Number of shares bought} = \frac{\text{Sum invested}}{\text{M.V. of each share}} = \frac{36 x}{30} = \frac{6 x}{5}$$

Since, dividend on each share =
$$12\%$$
 of ₹ $20 = ₹ 2.40$

$$\Rightarrow$$
 Total dividend received = Div. on 1 share \times No. of shares

$$= ₹ 2.40 \times \frac{6x}{5} = ₹ 2.88 x$$

Given, change in income = ₹ 192

$$3.20 x - 2.88 x = 192$$
, this gives $x = 600$

Number of shares sold by John
$$= 600$$

Ans.

Solution:

 \Rightarrow

Let the two parts be $\not\in x$ and $\not\in (40,608 - x)$.

For 1st part:

N.V. of each share
$$= 700$$

∴ Number of shares bought =
$$\frac{x}{92}$$
 [∴ Investment = ₹ x]

⇒ Total dividend = ₹ 8 ×
$$\frac{x}{92}$$
 = ₹ $\frac{2x}{23}$

For 2nd part:

Investment =
$$\mathbf{\xi}$$
 (40,608 - x)

$$\therefore \qquad \text{Number of shares bought} = \frac{40,608 - x}{108}$$

∴ Dividend on each share =
$$9\%$$
 of ₹ $100 = ₹ 9$ [∴ Rate = 9%]

Given, that dividends (incomes) from both the investments are equal

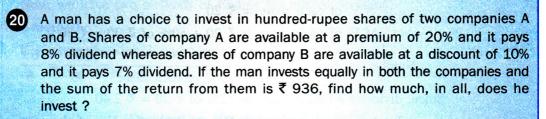

$$\Rightarrow \qquad \frac{2x}{23} = \frac{40,608 - x}{12}$$

On solving, we get:

$$x = 19872$$
 and $40,608 - x = 40,608 - 19872 = 20736$.

∴ The two parts are ₹ 19,872 and ₹ 20,736

Ans.

Solution:

Let the man invests $\overline{\xi}$ x in each company.

For company A:

∴ Number of shares bought =
$$\frac{x}{120}$$
 [∴ Investment = ₹ x]

∴ Dividend on each share =
$$8\%$$
 of ₹ $100 = ₹ 8$ [∴ Rate = 8%]

⇒ Total dividend = ₹ 8 ×
$$\frac{x}{120}$$
 = ₹ $\frac{x}{15}$

For company B:

∴ Number of shares bought =
$$\frac{x}{90}$$
 [∴ Investment = ₹ x]

∴ Dividend on each share =
$$7\%$$
 of ₹ $100 = ₹ 7$ [∴ Rate = 7%]

⇒ Total dividend = ₹ 7 ×
$$\frac{x}{90}$$
 = ₹ $\frac{7x}{90}$

Given, sum of dividend (return) from both the companies = ₹ 936

$$\Rightarrow \frac{x}{15} + \frac{7x}{90} = 936 \ i.e., x = 6480$$

⇒ The man invests ₹ 6,480 in each of the two companies

⇒ The man invests in all = ₹
$$2 \times 6{,}480 = ₹ 12{,}960$$
 Ans.

EXERCISE 3(B)

- 1. A man buys 75, ₹ 100 shares paying 9 percent dividend. He buys shares at such a price that he gets 12 percent of his money. At what price did he buy the shares?
- 2. By purchasing ₹ 25 gas shares for ₹ 40 each, a man gets 4 percent profit on his investment. What rate percent is the company paying? What is his dividend if he buys 60 shares?
- 3. Hundred rupee shares of a company are available in the market at a premium of ₹ 20. Find the rate of dividend given by the company when a man's return on his investment is 15 percent.
- 4. ₹ 50 shares of a company are quoted at a discount of 10%. Find the rate of dividend given by the company, the return on the investment on these shares being 20 percent.
- 5. A company declares 8 percent dividend to the share holders. If a man receives ₹ 2,840 as his dividend, find the nominal value of his shares.
- 6. How much should a man invest in ₹ 100 shares selling at ₹ 110 to obtain an annual income of ₹ 1,680, if the dividend declared is 12%?
- 7. A company declares a dividend of 11.2% to all its share-holders. If its ₹ 60 share is available in the market at a premium of 25%, how much should Rakesh invest, in buying the shares of this company, in order to have an annual income of ₹ 1,680 ?
- 8. A man buys 400, twenty-rupee shares at a premium of ₹ 4 each and receives a dividend of 12%. Find:
 - (i) the amount invested by him.
 - (ii) his total income from the shares.
 - (iii) percentage return on his money.
- 9. A man buys 400, twenty-rupee shares at a discount of 20% and receives a return of 12% on his money. Calculate:
 - (i) the amount invested by him.
 - (ii) the rate of dividend paid by the company.
- 10. A company, with 10,000 shares of ₹ 100 each, declares an annual dividend of 5%.
 - (i) What is the total amount of dividend paid by the company ?
 - (ii) What should be the annual income of a man who has 72 shares in the company?

(iii) If he received only 4% of his investment, find the price he paid for each share.

[2008]

11. A lady holds 1800, ₹ 100 shares of a company that pays 15% dividend annually. Calculate her annual dividend. If she had bought these shares at 40% premium, what is the return she gets as percent on her investment?

Give your answer to the nearest integer.

- 12. A man invests ₹ 11,200 in a company paying 6 percent per annum when its ₹ 100 shares can be bought for ₹ 140. Find:
 - (i) his annual dividend.
 - (ii) his percentage return on his investment.
- 13. Mr. Sharma has 60 shares of N.V. ₹ 100 and sells them when they are at a premium of 60%. He invests the proceeds in shares of nominal value ₹ 50, quoted at 4% discount, and paying 18% dividend annually. Calculate:
 - (i) the sale proceeds;
 - (ii) the number of shares he buys; and
 - (iii) his annual dividend from the shares.
- 14. A company with 10,000 shares of nominal value ₹ 100 declares an annual dividend of 8% to the share-holders.
 - (i) Calculate the total amount of dividend paid by the company.
 - (ii) Ramesh had bought 90 shares of the company at ₹ 150 per share. Calculate the dividend he receives and the percentage of return on his investment.
- 15. Which is the better investment:

 16% ₹ 100 shares at 80 or 20% ₹ 100 shares at 120 ?
- 16. A man has a choice to invest in hundred-rupee shares of two firms at ₹ 120 or at ₹ 132. The first firm pays a dividend of 5% per annum and the second firm pays a dividend of 6% per annum. Find:
 - (i) which company is giving a better return.
 - (ii) if a man invests ₹ 26,400 with each firm, how much will be the difference between the annual returns from the two firms?
- 17. A man bought 360, ten-rupee shares of a company, paying 12 percent per annum. He sold the shares when their price rose to

- ₹ 21 per share and invested the proceeds in five-rupee shares paying 4.5 percent per annum at ₹ 3.50 per share. Find the annual change in his income.
- 18. A man sold 400 (₹ 20) shares of a company, paying 5% at ₹ 18 and invested the proceeds in (₹ 10) shares of another company paying 7% at ₹ 12. How many (₹ 10) shares did he buy and what was the change in his income?
- 19. Two brothers A and B invest ₹ 16,000 each in buying shares of two companies. A buys

- 3% hundred-rupee shares at 80 and B buys ten-rupee shares at par. If they both receive equal dividend at the end of the year, find the rate percent of the dividend received by B.
- 20. A man invests ₹ 20,020 in buying shares of N.V. ₹ 26 at 10% premium. The dividend on the shares is 15% per annum. Calculate:
 - (i) the number of shares he buys.
 - (ii) the dividend he receives annually.
 - (iii) the rate of interest he gets on his money. (2003)

EXERCISE 3(C)

- 1. By investing ₹ 45,000 in 10% ₹ 100 shares, Sharad gets ₹ 3,000 as divided. Find the market value of each share.
- 2. Mrs. Kulkarni invests ₹ 1,31,040 in buying ₹ 100 shares at a discount of 9%. She sells shares worth ₹ 72,000 at a premium of 10% and the rest at a discount of 5%. Find her total gain or loss on the whole.
- 3. A man invests a certain sum in buying 15% ₹ 100 shares at 20% premium. Find :
 - (i) his income from one share.
 - (ii) the number of shares bought to have an income, from the dividend, ₹ 6,480.
 - (iii) sum invested.
- 4. Gagan invested 80% of his savings in 10% ₹ 100 shares at 20% premium and the rest of his savings in 20% ₹ 50 shares at 20% discount. If his incomes from these shares is ₹ 5,600, calculate:
 - (i) his investment in shares on the whole.
 - (ii) the number of shares of first kind that he bought.
 - (iii) percentage return, on the shares bought, on the whole.
- 5. A company pays a dividend of 15% on its ₹ 100 shares from which income tax at the rate of 20% is deducted. Find:
 - (i) the net annual income of Gopal who owns 7,200 shares of this company.
 - (ii) the sum invested by Ramesh when the shares of this company are bought by him at 20% premium and the gain required by him (after deduction of income tax) is ₹ 9,000.
- 6. Mr. Joseph sold some ₹ 100 shares, paying 10% dividend, at a discount of 25% and

- invested the proceeds in ₹ 100 shares, paying 16% dividend, at a discount of 20%. By doing so, his income was increased by ₹ 4,800. Find the number of shares originally held by Mr. Joseph.
- 7. Ashwarya bought 496, ₹ 100 shares at ₹ 132 each. Find:
 - (i) investment made by her.
 - (ii) income of Ashwarya from these shares, if the rate of dividend is 7.5%.
 - (iii) how much extra must Ashwarya invest in order to increase her income by ₹ 7,200?
- 8. Gopal has some ₹ 100 shares of company A, paying 10% dividend. He sells a certain number of these shares at a discount of 20% and invests the proceeds in ₹ 100 shares at ₹ 60 of company B paying 20% dividend. If his income, from the shares sold, increases by ₹ 18,000, find the number of shares sold by Gopal.
- 9. A man invests a certain sum of money in 6% hundred-rupee shares at ₹ 12 premium. When the shares fell to ₹ 96, he sold out all the shares bought and invested the proceed in 10%, ten-rupee shares at ₹ 8. If the change in his income is ₹ 540, find the sum invested orginally.
- 10. Mr. Gupta has a choice to invest in ten-rupee shares of two firms at ₹ 13 or at ₹ 16. If the first firm pays 5% dividend and the second firm pays 6% dividend per annum, find:
 - (i) which firm is paying better.
 - (ii) if Mr. Gupta invests equally in both the firms and the difference between the returns from them is ₹ 30, find how much, in all, does he invest?

- 11. A man invested ₹ 45,000 in 15% ₹ 100 shares quoted at ₹ 125. When the M.V. of these shares rose to ₹ 140, he sold some shares, just enough to raise ₹ 8,400. Calculate:
 - (i) the number of shares he still holds;
 - (ii) the dividend due to him on these remaining shares. [2004]
- 12. Mr. Tiwari invested ₹ 29,040 in 15% ₹ 100 shares quoted at a premium of 20%. Calculate:
 - (i) the number of shares bought by Mr. Tiwari.
 - (ii) Mr. Tiwari's income from the investment.
 - (iii) the percentage return on his investment.
- 13. A dividend of 12% was declared on ₹ 150 shares selling at a certain price. If the rate of return is 10%, calculate:
 - (i) the market value of the shares.
 - (ii) the amount to be invested to obtain an annual dividend of ₹ 1,350.
- 14. Divide ₹ 50,760 into two parts such that if one part is invested in 8% ₹ 100 shares at 8% discount and the other in 9% ₹ 100 shares at 8% premium, the annual incomes from both the investments are equal.
- 15. Mr. Shameem invested $33\frac{1}{3}\%$ of his savings in 20% ₹ 50 shares quoted at ₹ 60 and the remainder of the savings in 10% ₹ 100 shares quoted at ₹ 110. If his total income from these investments is ₹ 9,200; find :
 - (i) his total savings
 - (ii) the number of ₹ 50 shares.
 - (iii) the number of ₹ 100 shares.
- 16. Vivek invests ₹ 4,500 in 8%, ₹ 10 shares at ₹ 15. He sells the shares when the price rises to ₹ 30, and invests the proceeds in 12% ₹ 100 shares at ₹ 125. Calculate:

- (i) the sale proceeds
- (ii) the number of ₹ 125 shares he buys.
- (iii) the change in his annual income from dividend. [2010]
- 17. Mr. Parekh invested ₹ 52,000 on ₹ 100 shares at a discount of ₹ 20 paying 8% dividend. At the end of one year he sells the shares at a premium of ₹ 20. Find:
 - (i) the annual dividend.
 - (ii) the profit earned including his dividend.

[2011]

- 18. Salman buys 50 shares of face value ₹ 100 available at ₹ 132.
 - (i) What is his investment?
 - (ii) If the dividend is 7.5%, what will be his annual income?
 - (iii) If he wants to increase his annual income by ₹ 150, how many extra shares should he buy? [2013]
- 19. Salman invests a sum of money in ₹ 50 shares, paying 15% dividend quoted at 20% permium. If his annual dividend is ₹ 600, calculate:
 - (i) the number of shares he bought.
 - (ii) his total investment.
 - (iii) the rate of return on his investment.

[2014]

- 20. Rohit invested ₹ 9,600 on ₹ 100 shares at ₹ 20 premium paying 8% dividend. Rohit sold the shares when the price rose to ₹ 160. He invested the proceeds (excluding dividend) in 10% ₹ 50 shares at ₹ 40. Find the:
 - (i) original number of shares.
 - (ii) sale proceeds.
 - (iii) new number of shares.
 - (iv) change in the two dividends. [2015]
