

POINTS TO REMEMBER

1. **Equal figures** : Two plane figures having equal area are called equal figures.
2. **Congruent figures** : Two plane figures having the same shape and size are called congruent figures. But two plane figures having equal areas need not be congruent.
3. **Results on Area of polygon regions**
 - (i) Parallelograms on the same base and between the same parallels are equal in area.
 - (ii) The area of a parallelogram is equal to the area of the rectangle on the same base and of the same altitude *i.e.* between the same parallels.
 - (iii) Triangles on the same base and between the same parallels are equal in area.
4. **Some more results** :
 - (i) Area of a \parallel gm = Base \times height
 - (ii) Area of a triangle = $\frac{1}{2} \times$ Base \times height
 - (iii) Area of trapezium = $\frac{1}{2}$ (sum of parallel sides) \times height
 - (iv) Area of rhombus = $\frac{1}{2} \times$ Product of diagonals
5. (i) If a triangle and a parallelogram are on the same base and between the same parallels, then the area of triangle is half of the area of the parallelogram.
- (ii) Parallelograms on equal bases and between the same parallels are equal in area.

EXERCISE 16

Q. 1. In the adjoining figure, BD is a diagonal of quad. ABCD. Show that ABCD is a parallelogram and calculate the area of \parallel gm ABCD.

Sol. Given : BD is the diagonal of quadrilateral ABCD

AB = 6 cm, CD = 6 cm and BD = 8 cm

$\angle ABD = \angle BDC = 90^\circ$

To prove : (i) ABCD is a parallelogram.

(ii) Find the area of \parallel gm ABCD.

Proof : $\because \angle ABD = \angle BDC$

(each = 90°)

But these are alternate angles.

$\therefore AB \parallel DC$

But $AB = DC = 6$ cm

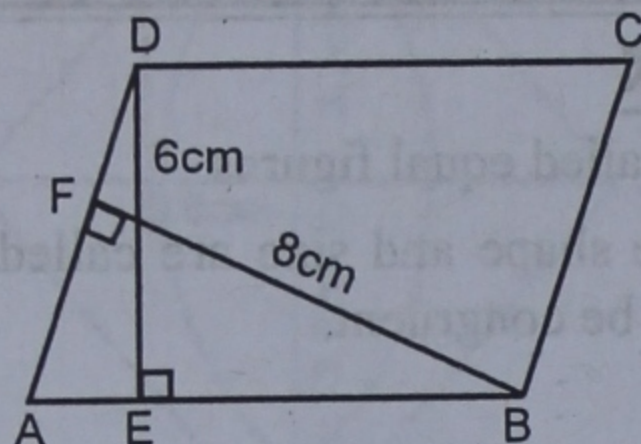

\therefore ABCD is a \parallel gm.

Now Area = Base \times Altitude

$= 6 \times 8 \text{ cm}^2 = 48 \text{ cm}^2$ Ans.

Q. 2. In a \parallel gm ABCD, it is given that $AB = 16$ cm and the altitudes corresponding to the sides AB and AD are 6 cm and 8 cm respectively.

Find the length of AD.

Sol. In \parallel gm ABCD, $AB = 16$ cm, altitudes on AB and AD are DE and BF are drawn and $DE = 7$ cm, $BF = 8$ cm

Area of \parallel gm ABCD = Base \times altitude

$$= AB \times DE$$

$$= 16 \times 6 = 96 \text{ cm}^2 \quad \dots(i)$$

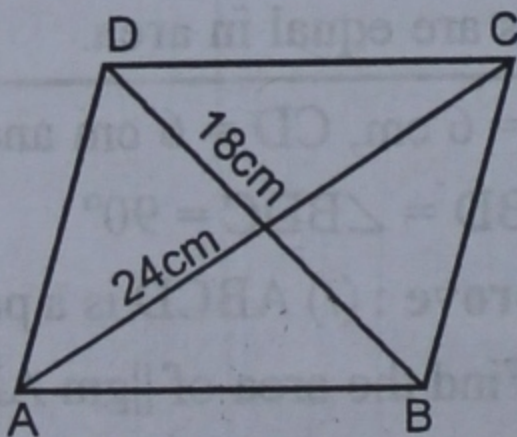

Again area of \parallel gm = AD \times BF

$$= AD \times 8 \text{ cm}^2 \quad \dots(ii)$$

From (i) and (ii)

$$8 \text{ AD} = 96 \Rightarrow \text{AD} = \frac{96}{8} = 12 \text{ cm Ans.}$$

Q. 3. Find the area of a rhombus, the lengths of whose diagonals are 18 cm and 24 cm respectively.

Sol. Let the first diagonal of rhombus

$$(d_1) = 18 \text{ cm}$$

and second diagonal $(d_2) = 24$ cm

$$\therefore \text{Area} = \frac{d_1 \times d_2}{2} = \frac{18 \times 24}{2} \text{ cm}^2$$

$$= 216 \text{ cm}^2 \text{ Ans.}$$

Q. 4. Find the area of a trapezium whose parallel sides measure 10 cm and 8 cm respectively and the distance between these sides is 6 cm.

Sol. In trapezium ABCD

$AB \parallel DC$ and $DL \perp AB$

$$AB = 10 \text{ cm, } DC = 8 \text{ cm}$$

and $DL = 6$ cm

Area of trapezium ABCD

$$= \frac{\text{Sum of parallel sides}}{2} \times \text{height}$$

$$= \frac{(10 + 8)}{2} \times 6 \text{ cm}^2$$

$$= \frac{18}{2} \times 6 = 54 \text{ cm}^2 \text{ Ans.}$$

Q. 5. Show that the line segment joining the mid-points of a pair of opposite sides of a parallelogram, divides it into two equal parallelograms.

Sol. Given : In \parallel gm ABCD,

P and Q are the mid points of sides AB and DC respectively. PQ is joined.

To prove : APQD and PBCQ are parallelograms of equal areas.

Proof : \because P and Q are mid points of AB and DC respectively.

$$\therefore AP = PB \quad \text{and} \quad DQ = QC$$

But $AB \parallel DC$ (opposite sides of \parallel gm)

$$\therefore AP \parallel DQ$$

$$\text{and } AP = DQ$$

$$\therefore \text{APQD is a } \parallel \text{ gm.}$$

Similarly PBCQ is a \parallel gm.

\therefore \parallel gms APQD and PBCQ are on the equal bases and between the same parallel lines.

\therefore area of \parallel gm APQD = area of \parallel gm PBCQ

Hence APQD and PBCQ are parallelograms of equal areas.

Q. 6. In the given figure, the area of \parallel gm ABCD is 90 cm^2 . State giving reasons :

- (i) ar (\parallel gm ABEF) (ii) ar (\triangle ABD)
(iii) ar (\triangle BEF).

Sol. Area of \parallel gm ABCD = 90 cm^2

AF \parallel BE are drawn and BD and BF are joined.

\therefore ABEF is a parallelogram.

- (i) Now \parallel gm ABCD and \parallel gm ABEF are on the same base and between the same parallel lines.

\therefore area of \parallel gm ABCD = area of \parallel gm ABEF

But area of \parallel gm ABCD = 90 cm^2

\therefore Area of \parallel gm ABEF = 90 cm^2

- (ii) \therefore BD and BF are the diagonals of \parallel gm ABCD and \parallel gm ABEF respectively and diagonals of a \parallel gm bisect it into two triangles of equal area.

\therefore Area (\triangle ABD) = $\frac{1}{2}$ area (\parallel gm ABCD)

$$= \frac{1}{2} \times 90 \text{ cm}^2 = 45 \text{ cm}^2$$

- (iii) and area (\triangle BEF) = $\frac{1}{2}$ area (\parallel gm ABEF)

$$= \frac{1}{2} \times 90 \text{ cm}^2 = 45 \text{ cm}^2 \text{ Ans.}$$

Q. 7. In the given figure, the area of \triangle ABC is 64 cm^2 . State giving reasons :

- (i) ar (\parallel gm ABCD)

- (ii) ar (rect. ABEF).

Sol. Area of \triangle ABC = 64 cm^2

\parallel gm ABCD and rectangle ABEF are drawn on the same base AB of \triangle ABC.

- (i) In \parallel gm ABCD, CA is its diagonal

$$\therefore \text{Area} (\triangle \text{ABC}) = \frac{1}{2} \text{ ar} (\parallel \text{ gm ABCD})$$

$$\Rightarrow \text{Area} \parallel \text{ gm ABCD} = 2 \text{ area} (\triangle \text{ABC}) \\ = 2 \times 64 \text{ cm}^2 = 128 \text{ cm}^2$$

- (ii) \therefore \parallel gm ABCD and rectangle are on the same base AB and between the same parallels.

$$\therefore \text{Area} (\parallel \text{ gm ABCD}) \\ = (\text{rectangle ABEF})$$

$$\therefore \text{Area} (\text{rectangle ABEF}) \\ = 128 \text{ cm}^2 \text{ Ans.}$$

Q. 8. In the given figure, ABCD is a quadrilateral. A line through D, parallel to AC, meets BC produced in P.

Prove that : ar (\triangle ABP)

$$= \text{ar} (\text{quad. ABCD}).$$

Sol. **Given :** In quad. ABCD, a line through D is drawn parallel to AC and meets BC produced in P.

To prove : Area (\triangle ABP)

$$= \text{area} (\text{quad. ABCD})$$

Proof : $\because AC \parallel PD$

and $\triangle ACD$ and $\triangle ACP$ are on the same base AC and between the same parallel lines.

$$\therefore \text{area}(\triangle ACD) = \text{area}(\triangle ACP)$$

Adding area $(\triangle ABC)$ both sides,

$$\text{area}(\triangle ACD) + \text{area}(\triangle ABC)$$

$$= \text{area}(\triangle ACP) + \text{area}(\triangle ABC)$$

$$\Rightarrow \text{area}(\text{quad } ABCD) = \text{area}(\triangle ABP)$$

$$\text{or } \text{ar}(\triangle ABP) = \text{ar}(\text{quad. } ABCD)$$

Hence proved.

Q. 9. $ABCD$ is a quadrilateral. If $AL \perp BD$ and $CM \perp BD$, prove that : $\text{ar}(\text{quad. } ABCD) = \frac{1}{2} \times BD \times (AL + CM)$.

Sol. Given : In quadrilateral $ABCD$, $AL \perp BD$ and $CM \perp BD$.

To prove : $\text{ar}(\text{quad } ABCD)$

$$= \frac{1}{2} \times BD \times (AL + CM)$$

Proof : $\text{ar}(\triangle ABD) = \frac{1}{2} \text{ base} \times \text{altitude}$

$$= \frac{1}{2} BD \times AL \quad \dots(i)$$

Again $\text{ar}(\triangle BCD)$

$$= \frac{1}{2} \times BD \times CM \quad \dots(ii)$$

Adding (i) and (ii)

$$\text{ar}(\triangle ABD) + \text{ar}(\triangle BCD)$$

$$= \frac{1}{2} BD \times AL + \frac{1}{2} BD \times CM$$

$$\Rightarrow \text{ar}(\text{quad } ABCD)$$

$$= \frac{1}{2} BD (AL + CM)$$

Hence proved

Q. 10. In the given figure, D is the mid-point of BC and E is any point on AD .

Prove that :

$$(i) \text{ar}(\triangle EBD) = \text{ar}(\triangle EDC).$$

$$(ii) \text{ar}(\triangle ABE) = \text{ar}(\triangle ACE).$$

Sol. Given : In $\triangle ABC$, D is mid point of BC and E is any point on AD .

To prove : (i) $\text{ar}(\triangle EBD) = \text{ar}(\triangle EDC)$.

(ii) $\text{ar}(\triangle ABE) = \text{ar}(\triangle ACE)$.

Proof : In $\triangle ABC$,

AD is the median of the triangle

$$\therefore \text{ar}(\triangle ABD) = \text{ar}(\triangle ACD)$$

Again in $\triangle EBC$,

ED is the median of $\triangle EBC$

$$(i) \therefore \text{ar}(\triangle EBD) = \text{ar}(\triangle EDC) \quad \dots(ii)$$

(ii) Subtracting (ii) from (i)

$$\text{ar}(\triangle ABD) - \text{ar}(\triangle EBD)$$

$$= \text{ar}(\triangle ACE) - \text{ar}(\triangle ECB)$$

$$\Rightarrow \text{ar}(\triangle ABE) = \text{ar}(\triangle ACE)$$

Hence proved.

Q. 11. In the given figure, D is the mid-point of BC and E is the mid-point of AD .

Prove that : $\text{ar}(\triangle ABE)$

$$= \frac{1}{4} \text{ar}(\triangle ABC).$$

Sol. Given : In $\triangle ABC$, D is mid point of BC and E is mid point on AD. CE and BE are joined.

To prove : $\text{ar}(\triangle ABE)$

$$= \frac{1}{4} \text{ar}(\triangle ABC).$$

Proof : In $\triangle ABC$, AD is the median

$$\therefore \text{ar}(\triangle ABD) = \text{ar}(\triangle ACD)$$

$$= \frac{1}{2} \text{ar}(\triangle ABC) \quad \dots(i)$$

Again in $\triangle ABD$, BE is the median

$$\therefore \text{ar}(\triangle ABE) = \text{ar}(\triangle EBD)$$

$$= \frac{1}{2} \text{ar}(\triangle ABD)$$

$$= \frac{1}{2} \times \frac{1}{2} \text{ar}(\triangle ABC) \quad [\text{from } (i)]$$

$$= \frac{1}{4} \text{ar}(\triangle ABC)$$

Hence proved.

Q. 12. In the given figure, a point D is taken on side BC of $\triangle ABC$ and AD is produced to E, making $DE = AD$.

Show that : $\text{ar}(\triangle BEC) = \text{ar}(\triangle ABC)$.

Sol. Given : In $\triangle ABC$, D is any point on BC, AD is joined and produced to E such that $DE = AD$.

BE and CE are joined.

To prove : $\text{ar}(\triangle BEC) = \text{ar}(\triangle ABC)$.

Proof : $\therefore AD = DE$ (given)

\therefore D is mid point of AE.

Now in $\triangle ABE$, BD is the median

$$\therefore \text{ar}(\triangle BDE) = \text{ar}(\triangle ABD) \quad \dots(i)$$

Similarly, in $\triangle ACE$, CD is the median

$$\therefore \text{ar}(\triangle CDE) = \text{ar}(\triangle ACD) \quad \dots(ii)$$

Adding (i) and (ii)

$$\text{ar}(\triangle BDE) + \text{ar}(\triangle CDE) = \text{ar}(\triangle ABD) + \text{ar}(\triangle ACD)$$

$$\Rightarrow \text{ar}(\triangle BEC) = \text{ar}(\triangle ABC)$$

Hence proved.

Q. 13. If the medians of a $\triangle ABC$ intersect at G, show that :

$$\text{ar}(\triangle AGB) = \text{ar}(\triangle AGC) = \text{ar}(\triangle BGC)$$

$$= \frac{1}{3} \text{ar}(\triangle ABC)$$

Sol. Given : In $\triangle ABC$, AD, BE and CF are the medians of the sides BC, CA and AB respectively intersecting at the point G.

To prove : $\text{ar}(\triangle AGB) = \text{ar}(\triangle AGC)$

$$= \text{ar}(\triangle BGC) = \frac{1}{3} \text{ar}(\triangle ABC)$$

Proof : In $\triangle ABC$, AD is the median

$$\therefore \text{ar}(\triangle ABD) = \text{ar}(\triangle ACD) \quad \dots(i)$$

Again in $\triangle GBC$, GD is the median

$$\therefore \text{ar}(\triangle GBD) = \text{ar}(\triangle GCD) \quad \dots(ii)$$

Subtracting (ii) from (i)

$$\text{ar}(\triangle ABD) - \text{ar}(\triangle GBD) = \text{ar}(\triangle ACD) - \text{ar}(\triangle GCD)$$

$$\Rightarrow \text{ar}(\triangle AGB) = \text{ar}(\triangle AGC) \quad \dots(iii)$$

Similarly we can prove that

$$\text{ar}(\triangle AGC) = \text{ar}(\triangle BGC) \quad \dots(iv)$$

From (iii) and (iv)

$$\text{ar}(\triangle AGB) = \text{ar}(\triangle AGC) = \text{ar}(\triangle BGC)$$

$$\text{But ar}(\triangle AGB) + \text{ar}(\triangle AGC)$$

$$+ \text{ar}(\triangle BGC) = \text{ar}(\triangle ABC)$$

$$= \text{ar}(\triangle AGB) = \text{ar}(\triangle AGC) = \text{ar}(\triangle BGC)$$

$$= \frac{1}{3} \text{ar}(\triangle ABC)$$

Hence proved.

Q. 14. D is a point on base BC of a $\triangle ABC$ such that $2BD = DC$.

$$\text{Prove that : ar}(\triangle ABD) = \frac{1}{3} \text{ar}(\triangle ABC).$$

Sol. **Given :** In $\triangle ABC$, D is a point on BC such that $2BD = DC$.

$$\text{To prove : ar}(\triangle ABD) = \frac{1}{3} \text{ar}(\triangle ABC).$$

Proof : In $\triangle ABC$,

$$\because 2BD = DC \Rightarrow \frac{BD}{DC} = \frac{1}{2}$$

$$\Rightarrow BD : DC = 1 : 2$$

$$\therefore \text{ar}(\triangle ABD) : \text{ar}(\triangle ADC) = 1 : 2$$

$$\text{But ar}(\triangle ABD) + \text{ar}(\triangle ADC)$$

$$= \text{ar}(\triangle ABC)$$

$$\Rightarrow \text{ar}(\triangle ABD) + 2 \text{ar}(\triangle ABD)$$

$$= \text{ar}(\triangle ABC)$$

$$\Rightarrow 3 \text{ar}(\triangle ABD) = \text{ar}(\triangle ABC)$$

$$\Rightarrow \text{ar}(\triangle ABD) = \frac{1}{3} \text{ar}(\triangle ABC)$$

Hence proved.

Q. 15. In the given figure, AD is a median of $\triangle ABC$ and P is a point on AC such that :

$$\text{ar}(\triangle ADP) : \text{ar}(\triangle ABD) = 2 : 3.$$

Find : (i) AP : PC

(ii) $\text{ar}(\triangle PDC) : \text{ar}(\triangle ABC)$.

Sol. **Given :** In $\triangle ABC$, AD is median of the triangle, P is a point on AC such that :

$$\text{ar}(\triangle ADP) : \text{ar}(\triangle ABD) = 2 : 3,$$

now we have

To find : (i) AP : PC

(ii) $\text{ar}(\triangle PDC) : \text{ar}(\triangle ABC)$.

(i) In $\triangle ABC$, AD is the median

$$\therefore \text{ar}(\triangle ABD) = \text{ar}(\triangle ADC) \quad \dots(i)$$

$$\because \text{ar}(\triangle ADP) : \text{ar}(\triangle ABD) = 2 : 3$$

$$\Rightarrow \text{ar}(\triangle ADP) : \text{ar}(\triangle ADC) = 2 : 3$$

[from (i)]

$$\Rightarrow \text{ar}(\triangle ADC) : \text{ar}(\triangle ADP) = 3 : 2$$

$$\Rightarrow \frac{\text{ar}(\triangle ADC)}{\text{ar}(\triangle ADP)} = \frac{3}{2}$$

$$\Rightarrow \frac{\text{ar}(\triangle ADC)}{\text{ar}(\triangle ADP)} - 1 = \frac{3}{2} - 1$$

(Subtracting 1 from both sides)

$$\Rightarrow \frac{\text{ar}(\triangle ADC) - \text{ar}(\triangle ADP)}{\text{ar}(\triangle ADP)} = \frac{1}{2}$$

$$\Rightarrow \frac{\text{ar}(\triangle ADP)}{\text{ar}(\triangle PDC)} = \frac{2}{1} \quad \dots(ii)$$

$$\Rightarrow \text{ar}(\triangle ADP) : \text{ar}(\triangle PDC) = 2 : 1$$

$$\therefore \text{AP} : \text{PC} = 2 : 1$$

$$(ii) \text{ Now } \frac{\text{ar}(\triangle ADP)}{\text{ar}(\triangle PDC)} = \frac{2}{1} \quad (\text{from (ii)})$$

Adding 1 both sides, we get

$$\frac{\text{ar}(\triangle ADP)}{\text{ar}(\triangle PDC)} + 1 = \frac{2}{1} + 1$$

$$\frac{\text{ar}(\triangle ADP) + \text{ar}(\triangle PDC)}{\text{ar}(\triangle PDC)} = \frac{2}{1} + 1$$

$$\frac{\text{ar}(\triangle ADC)}{\text{ar}(\triangle PDC)} = \frac{3}{1}$$

But $\text{ar}(\triangle ADC) = \text{ar}(\triangle ABD)$

[from (i)]

$$\therefore \frac{\text{ar}(\triangle ADB)}{\text{ar}(\triangle PDC)} = \frac{3}{1}$$

$$\Rightarrow \frac{\text{ar}(\triangle PDC)}{\text{ar}(\triangle ABD)} = \frac{1}{3}$$

But $\text{ar}(\triangle ABD) = \frac{1}{2} \text{ar}(\triangle ABC)$

$$\therefore \frac{\text{ar}(\triangle PDC)}{\frac{1}{2} \text{ar}(\triangle ABC)} = \frac{1}{3}$$

$$\Rightarrow \frac{2 \text{ar}(\triangle PDC)}{\text{ar}(\triangle ABC)} = \frac{1}{3}$$

$$\Rightarrow \frac{\text{ar}(\triangle PDC)}{\text{ar}(\triangle ABC)} = \frac{1}{3 \times 2} = \frac{1}{6}$$

Hence $\text{ar}(\triangle PDC) : \text{ar}(\triangle ABC) = 1 : 6$

Q. 16. In the given figure, P is a point on side BC of $\triangle ABC$ such that $BP : PC = 1 : 2$ and Q is a point on AP such that $PQ : QA = 2 : 3$.

Show that : $\text{ar}(\triangle AQC) : \text{ar}(\triangle ABC)$

$$= 2 : 5.$$

Sol. **Given :** In $\triangle ABC$, P is a point on BC such that $BP : PC = 1 : 2$. Q is a point on AP such that $PQ : QA = 2 : 3$.

To prove : $\text{ar}(\triangle AQC) : \text{ar}(\triangle ABC)$

$$= 2 : 5$$

Proof : In $\triangle ABC$, P is a point on BC such that

$$BP : PC = 1 : 2$$

$$\therefore \text{ar}(\triangle APB) : \text{ar}(\triangle APC) = 1 : 2$$

$$\text{ar}(\triangle APC) = \frac{2}{3} \text{ar}(\triangle ABC)$$

Again In $\triangle APC$,

Q is a point on AP such that $PQ : QA = 2 : 3$

$$\Rightarrow \text{ar}(\triangle AQC) : \text{ar}(\triangle PQC) = 3 : 2$$

$$\text{or } \text{ar}(\triangle AQC) = \frac{3}{5} \text{ar}(\triangle APC)$$

$$= \frac{3}{5} \times \frac{2}{3} \times \text{ar}(\triangle ABC)$$

$$= \frac{2}{5} \text{ar}(\triangle ABC)$$

$$\Rightarrow \frac{\text{ar}(\triangle AQC)}{\text{ar}(\triangle ABC)} = \frac{2}{5}$$

$$\therefore \text{ar}(\triangle AQC) : \text{ar}(\triangle ABC) = 2 : 5$$

Hence proved.

Q. 17. In the adjoining figure, ABCD is a parallelogram. P and Q are any two points on the sides AB and BC respectively.

Prove that : $\text{ar}(\triangle CPD) = \text{ar}(\triangle AQD)$.

Sol. **Given :** In $\parallel \text{gm } ABCD$, P and Q are any two points on the sides AB and BC respectively.

AQ, DQ, CP and DP are joined.

To prove : $\text{ar}(\triangle CPD) = \text{ar}(\triangle AQD)$.

Proof : $\triangle CPD$ and $\parallel \text{gm } ABCD$ are on the same base CD and between the same parallel lines.

$$\therefore \text{ar}(\triangle CPD) = \frac{1}{2} \text{ar}(\parallel \text{gm } ABCD) \dots (i)$$

Similarly, $\triangle AQD$ and $\parallel \text{gm } ABCD$ are on the same base AD and between the same parallel lines.

$$\therefore \text{ar}(\triangle AQD) = \frac{1}{2} \text{ar}(\parallel \text{gm } ABCD) \dots (ii)$$

From (i) and (ii)

$$\text{ar}(\Delta CPD) = \text{ar}(\Delta AQD)$$

Hence proved.

Q. 18. In the adjoining figure, $DE \parallel BC$.

Prove that : (i) $\text{ar}(\Delta ABE) = \text{ar}(\Delta ACD)$

(ii) $\text{ar}(\Delta OBD) = \text{ar}(\Delta OCE)$

Sol. Given : In ΔABC , $DE \parallel BC$

To prove : (i) $\text{ar}(\Delta ABE) = \text{ar}(\Delta ACD)$

(ii) $\text{ar}(\Delta OBD) = \text{ar}(\Delta OCE)$

Proof : (i) In ΔABC , $DE \parallel BC$

ΔBDE and ΔCDE are on the same base DE and between the same parallels.

$$\therefore \text{ar}(\Delta BDE) = \text{ar}(\Delta CDE) \quad \dots(i)$$

Adding $\text{ar}(\Delta ADE)$ both sides of (i)

$$\begin{aligned} \text{ar}(\Delta BDE) + \text{ar}(\Delta ADE) \\ = \text{ar}(\Delta CDE) + \text{ar}(\Delta ADE) \end{aligned}$$

$$\Rightarrow \text{ar}(\Delta ABE) = \text{ar}(\Delta ACD)$$

(ii) Subtracting $\text{ar}(\Delta DOE)$ from both sides of (i)

$$\begin{aligned} \text{ar}(\Delta BDE) - \text{ar}(\Delta DOE) &= \text{ar}(\Delta CDE) \\ &\quad - \text{ar}(\Delta DOE) \end{aligned}$$

$$\Rightarrow \text{ar}(\Delta OBD) = \text{ar}(\Delta OCE)$$

Hence proved.

Q. 19. In the given figure, $ABCD$ is a parallelogram and P is a point on BC .

Prove that : $\text{ar}(\Delta ABP) + \text{ar}(\Delta DPC)$
 $= \text{ar}(\Delta APD)$

Sol. Given : In \parallel gm $ABCD$, P is a point on BC

To prove : $\text{ar}(\Delta ABP) + \text{ar}(\Delta DPC)$
 $= \text{ar}(\Delta APD)$

Construction : From P , draw $PQ \parallel AB$ or DC

Proof : \because $OPCD$ is a \parallel gm and PD is the diagonal

$$\therefore \text{ar}(\Delta DPC) = \text{ar}(\Delta QPD) \quad \dots(i)$$

Similarly $ABPQ$ is a \parallel gm and AP is the diagonal

$$\therefore \text{ar}(\Delta ABP) = \text{ar}(\Delta APQ) \quad \dots(ii)$$

Adding (i) and (ii)

$$\begin{aligned} \text{ar}(\Delta DPC) + \text{ar}(\Delta ABP) \\ = \text{ar}(\Delta QPD) + \text{ar}(\Delta APQ) \end{aligned}$$

$$\Rightarrow \text{ar}(\Delta ABP) + \text{ar}(\Delta DPC) = \text{ar}(\Delta APD)$$

Hence proved.

Q. 20. In the adjoining figure, $ABCDE$ is a pentagon. BP drawn parallel to AC meets DC produced at P and EQ drawn parallel to AD meets CD produced at Q .

Prove that : $\text{ar}(\text{Pentagon } ABCDE)$
 $= \text{ar}(\Delta APQ)$

Sol. Given : In a pentagon $ABCDE$, AC and AD are joined. From B , $BP \parallel AC$ and from E , $EQ \parallel AD$ are drawn to meet CD

produced on both sides at P and Q respectively.

To prove : ar (Pentagon ABCDE)
= ar (Δ APQ)

Construction : Given AP and AQ

Proof : \because BP \parallel AC and Δ ABC and Δ APC are on the same base AC and between the same parallel lines.

$$\therefore \text{ar}(\Delta ABC) = \text{ar}(\Delta APC) \quad \dots(i)$$

$$\text{Similarly ar}(\Delta ADE) = \text{ar}(\Delta APQ) \quad \dots(ii)$$

$$\text{and ar}(\Delta ACD) = \text{ar}(\Delta ACD) \quad \dots(iii)$$

Adding (i), (ii) and (iii)

$$\text{ar}(\Delta ABC) + \text{ar}(\Delta ADE) + \text{ar}(\Delta ACD)$$

$$= \text{ar}(\Delta APC) + \text{ar}(\Delta ADQ) + \text{ar}(\Delta ACD)$$

$$\Rightarrow \text{ar}(\Delta APQ) = \text{ar}(\text{pentagon } ABCDE)$$

Hence proved.

Q. 21. In the adjoining figure, two parallelograms ABCD and AEFB are drawn on opposite sides of AB.

Prove that : ar (\parallel gm ABCD)

$$+ \text{ar}(\parallel \text{ gm AEFB}) = \text{ar}(\parallel \text{ gm EFCD}).$$

Sol. Given : \parallel gm ABCD and \parallel gm AEFB are drawn on the opposite sides of AB. DE and FC are joined.

To prove : ar (\parallel gm ABCD)

$$+ \text{ar}(\parallel \text{ gm AEFB}) = \text{ar}(\parallel \text{ gm EFCD})$$

Proof : In Δ ADE and Δ BFC

$$AD = BC$$

{ \because Opposite sides of a parallelogram are equal }

$$AE = BF$$

$$DE = CF$$

$$\therefore \Delta ADE \cong \Delta BFC$$

$$\Rightarrow \text{ar}(\Delta ADE) = \text{ar}(\Delta BFC) \quad \dots(i)$$

(\because Congruent triangles are equal in area)

$$\text{Now ar}(\parallel \text{ gm } ABCD) + \text{ar}(\parallel \text{ gm } AEFB)$$

$$= \text{ar}(\parallel \text{ gm } EFCD) - \text{ar}(\Delta ADE)$$

$$+ \text{ar}(\Delta BFC)$$

$$= \text{ar}(\parallel \text{ gm } EFCD) - \text{ar}(\Delta ADE)$$

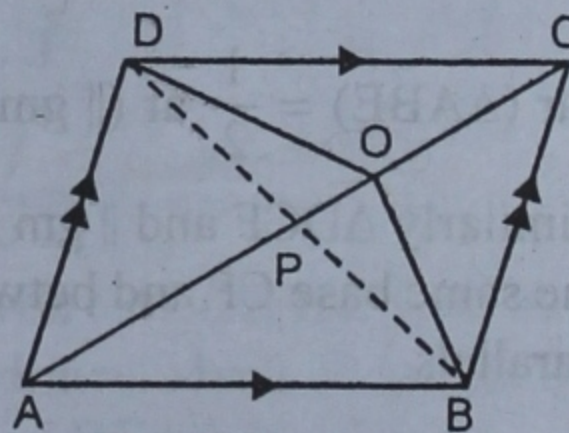

$$+ \text{ar}(\Delta ADE) \text{ [from (i)]}$$

$$= \text{ar}(\parallel \text{ gm } EFCD)$$

Hence proved.

Q. 22. In the adjoining figure, ABCD is a parallelogram and O is any point on its diagonal AC.

Show that : ar (Δ AOB) = ar (Δ AOD).

Sol. In \parallel gm ABCD, O is any point on its diagonal. OB and OD are joined.

To prove : ar (Δ AOB) = ar (Δ AOD)

Construction : Join BD which intersects AC at P.

Proof : \because Diagonals of a \parallel gm bisect each other

$$\therefore AP = PC \quad \text{and} \quad BP = PD$$

Now in Δ ABD, AP is its median

$$\therefore \text{ar}(\Delta ABP) = \text{ar}(\Delta ADP) \quad \dots(i)$$

Similarly in Δ OBD, OP is the median

$$\therefore \text{ar}(\Delta OBP) = \text{ar}(\Delta ODP) \quad \dots(ii)$$

Adding (i) and (ii)

$$\text{ar}(\triangle APB) + \text{ar}(\triangle OBP) = \text{ar}(\triangle ADP) + \text{ar}(\triangle ODP)$$

$$\Rightarrow \text{ar}(\triangle AOB) = \text{ar}(\triangle AOD)$$

Hence proved

Q. 23. In the given figure, $XY \parallel BC$, $BE \parallel CA$ and $FC \parallel AB$.

Prove that : $\text{ar}(\triangle ABE) = \text{ar}(\triangle ACF)$

Sol. Given : In the figure, $XY \parallel BC$, $BE \parallel CA$ and $FC \parallel AB$.

To prove : $\text{ar}(\triangle ABE) = \text{ar}(\triangle ACF)$

Proof : $\triangle ABE$ and \parallel gm BCYE are on the same base BE and between the same parallels

$$\therefore \text{ar}(\triangle ABE) = \frac{1}{2} \text{ar}(\parallel \text{ gm BCYE}) \dots(i)$$

Similarly $\triangle DCF$ and \parallel gm BCFX are on the same base CF and between the same parallels.

$$\therefore \text{ar}(\triangle ACF) = \frac{1}{2} \text{ar}(\parallel \text{ gm BCFX}) \dots(ii)$$

But \parallel gm BCFX and \parallel gm BCYE are on the same base BC and between the same parallels.

$$\therefore \text{ar}(\parallel \text{ gm BCFX}) = \text{ar}(\parallel \text{ gm BCYE}) \dots(iii)$$

From (i), (ii) and (iii)

$$\text{ar}(\triangle ABE) = \text{ar}(\triangle ACF)$$

Hence proved.

Q. 24. In the given figure, the side AB of \parallel gm ABCD is produced to a point P. A line through A drawn parallel to CP meets

CB produced in Q and the parallelogram PBQR is completed.

Prove that : $\text{ar}(\parallel \text{ gm ABCD}) = \text{ar}(\parallel \text{ gm BPRQ})$.

Sol. Given : Side AB of \parallel gm ABCD is produced to P. CP is joined through A, a line is drawn parallel to CP meeting CB produced at Q and \parallel gm PBQR is completed as shown in the figure.

To prove : $\text{ar}(\parallel \text{ gm ABCD}) = \text{ar}(\parallel \text{ gm BPRQ})$

Construction : Join AC and PQ.

Proof : $\triangle AQC$ and $\triangle AQP$ are on the same base AQ and between the same parallels

$$\therefore \text{ar}(\triangle AQC) = \text{ar}(\triangle AQP)$$

Subtracting $\text{ar}(\triangle AQB)$ from both sides,
 $\text{ar}(\triangle AQC) - \text{ar}(\triangle AQB) = \text{ar}(\triangle AQP) - \text{ar}(\triangle AQB)$

$$\Rightarrow \text{ar}(\triangle ABC) = \text{ar}(\triangle BPQ) \dots(i)$$

$$\text{But ar}(\triangle ABC) = \frac{1}{2} \text{ar}(\parallel \text{ gm ABCD}) \dots(ii)$$

$$\text{and ar}(\triangle BPQ) = \frac{1}{2} \text{ar}(\parallel \text{ gm BPRQ}) \dots(iii)$$

From (i), (ii) and (iii)

$$= \frac{1}{2} \text{ar}(\parallel \text{ gm ABCD})$$

$$= \frac{1}{2} \text{ar}(\parallel \text{ gm BPRQ})$$

$$\Rightarrow \text{ar}(\parallel \text{ gm ABCD}) = \text{ar}(\parallel \text{ gm BPRQ})$$

Hence proved.

Q. 25. In the adjoining figure, CE is drawn parallel to DB to meet AB produced at E.

Prove that : ar (quad. ABCD)
= ar ($\triangle DAE$).

Sol. Given : In the given figure, CE is drawn parallel to BD which meets AB produced at E.

DE is joined.

To prove : ar (quad. ABCD)
= ar ($\triangle DAE$)

Proof : $\triangle DBE$ and $\triangle DBC$ are on the same base BD and between the same parallels.

$$\therefore \text{ar}(\triangle DBE) = \text{ar}(\triangle DBC)$$

Adding ar ($\triangle ABD$) both sides,

$$\text{ar}(\triangle DBE) + \text{ar}(\triangle ABD) = \text{ar}(\triangle DBC) + \text{ar}(\triangle ABD)$$

$$\Rightarrow \text{ar}(\triangle ADE) = \text{ar}(\text{quad. ABCD})$$

$$\Rightarrow \text{ar}(\text{quad. ABCD}) = \text{ar}(\triangle DAE)$$

Hence proved.

Q. 26. In the adjoining figure, ABCD is a parallelogram. AB is produced to a point P and DP intersects BC at Q.

Prove that : ar ($\triangle APD$)
= ar (quad. BPCD).

Sol. Given : In \parallel gm ABCD, AB is produced point P and DP intersects BC at Q.

To prove : ar ($\triangle APD$) = ar (quad BPCD)

Construction : Join BD.

Proof : $\triangle BPD$ and $\triangle BPC$ are on the same base BP and between the same parallels.

$$\therefore \text{ar}(\triangle BPD) = \text{ar}(\triangle BPC) \quad \dots(i)$$

In \parallel gm ABCD, BD is its diagonal

$$\therefore \text{ar}(\triangle ABD) = \text{ar}(\triangle DBC) \quad \dots(ii)$$

Adding (i) and (ii)

$$\text{ar}(\triangle BPD) + \text{ar}(\triangle ABD) = \text{ar}(\triangle BPC) + \text{ar}(\triangle DBC)$$

$$\Rightarrow \text{ar}(\triangle APD) = \text{ar}(\text{quad BPCD})$$

Hence proved.

Q. 27. In the adjoining figure, ABCD is a parallelogram. Any line through A cuts DC at a point P and BC produced at Q.

Prove that : ar ($\triangle BPC$) = ar ($\triangle DPQ$).

Sol. Given : ABCD is a \parallel gm. A line through A, drawn which intersects DC at a point P and BC produced at Q.

To prove : ar ($\triangle BPC$) = ar ($\triangle DPQ$)

Construction : Join AC and BP.

Proof : $\triangle BPC$ and $\triangle APC$ are on the same base BC and between the same parallels.

$$\therefore \text{ar}(\triangle BPC) = \text{ar}(\triangle APC) \quad \dots(i)$$

Again $\triangle AQC$ and $\triangle DQC$ are on the same base QC and between the same parallels.

$$\therefore \text{ar}(\triangle AQC) = \text{ar}(\triangle DQC) \quad \dots(ii)$$

$$\text{Now ar}(\triangle BPC) = \text{ar}(\triangle APC)$$

[from (i)]

$$\begin{aligned}
 &= \text{ar}(\Delta AQC) - \text{ar}(\Delta PQC) \\
 &= \text{ar}(\Delta DQC) - \text{ar}(\Delta PQC) \quad [\text{from (ii)}] \\
 &= \text{ar}(\Delta DPQ)
 \end{aligned}$$

Hence proved.

Q. 28. In the adjoining figure, ABCD is a parallelogram. P is a point on BC such that $BP : PC = 1 : 2$. DP produced meets AB produced at Q.

Given $\text{ar}(\Delta CPQ) = 20 \text{ cm}^2$.

Calculate : (i) $\text{ar}(\Delta CDP)$

(ii) $\text{ar}(\parallel \text{gm ABCD})$.

Sol. Given : ABCD is a parallelogram.

P is a point on BC such that $BP : PC = 1 : 2$

DP is produced to meet AB produced at Q

$$\text{ar}(\Delta CPQ) = 20 \text{ cm}^2$$

CQ is joined.

(i) $\because BP : PC = 1 : 2$

$$\therefore \text{ar}(\Delta BPQ) : \text{ar}(\Delta CPQ) = 1 : 2$$

$$\Rightarrow \text{ar}(\Delta BPQ) = \frac{1}{2} \text{ar}(\Delta CPQ)$$

$$= \frac{1}{2} \times 20 \text{ cm}^2 = 10 \text{ cm}^2$$

Now in ΔBPQ and ΔCPD ,

$$\angle BPQ = \angle DPC$$

(Vertically opposite angles)

$$\angle BQP = \angle PDC \quad (\text{alternate angles})$$

$$\therefore \angle BPQ \sim \Delta CPD$$

$$\therefore \frac{\text{ar}(\Delta CPD)}{\text{ar}(\Delta BPQ)} = \frac{(PC)^2}{BP^2} = \frac{(2)^2}{(1)^2} = \frac{4}{1}$$

$$\begin{aligned}
 \therefore \text{ar}(\Delta CPD) &= 4 \text{ar}(\Delta BPQ) \\
 &= 4 \times 10 \text{ cm}^2 = 40 \text{ cm}^2 \text{ Ans.}
 \end{aligned}$$

$$\begin{aligned}
 \text{(ii) ar}(\Delta CQD) &= \text{ar}(\Delta CPD) + \text{ar}(\Delta CPQ) \\
 &= (40 + 20) \text{ cm}^2 = 60 \text{ cm}^2
 \end{aligned}$$

But ΔCQD and $\parallel \text{gm ABCD}$ are on the same base DC and between the same parallels.

$$\therefore \text{ar}(\Delta CQD) = \frac{1}{2} \text{ar}(\parallel \text{gm ABCD})$$

$$\begin{aligned}
 \Rightarrow \text{ar}(\parallel \text{gm ABCD}) &= 2 \text{ar}(\Delta CQD) \\
 &= 2 \times 60 \text{ cm}^2 = 120 \text{ cm}^2 \text{ Ans.}
 \end{aligned}$$

Q. 29. In the adjoining figure, ABCD is a parallelogram. P is a point on DC such that $\text{ar}(\Delta APD) = 25 \text{ cm}^2$ and $\text{ar}(\Delta BPC) = 15 \text{ cm}^2$.

Calculate : (i) $\text{ar}(\parallel \text{gm ABCD})$

(ii) DP : PC.

Sol. ABCD is a $\parallel \text{gm}$. P is a point on DC such that $\text{ar}(\Delta APD) = 25 \text{ cm}^2$ and $\text{ar}(\Delta BPC) = 15 \text{ cm}^2$

Through P, draw $PQ \parallel AD$ or BC

(i) Now in $\parallel \text{gm AQP D}$,

AP is its diagonal

\therefore AP divides it into two triangles equal in area

$$\therefore \text{ar}(\Delta APD) = \text{ar}(\Delta APQ) \quad \dots(i)$$

Similarly in \parallel gm QBCP,

PB is its diagonal

$$\therefore \text{ar}(\Delta BPC) = \text{ar}(\Delta PQB) \quad \dots(ii)$$

Adding (i) and (ii)

$$\begin{aligned} \text{ar}(\Delta APQ) + \text{ar}(\Delta PQB) &= \text{ar}(\Delta APD) \\ &+ \text{ar}(\Delta BPC) \end{aligned}$$

$$\begin{aligned} \Rightarrow \text{ar}(\Delta APB) &= 25 \text{ cm}^2 + 15 \text{ cm}^2 \\ &= 40 \text{ cm}^2 \end{aligned}$$

Now ΔAPB and \parallel gm ABCD are on the same base AB and between the same parallels.

$$\therefore \text{ar}(\Delta APB) = \frac{1}{2} (\parallel \text{ gm ABCD})$$

$$\begin{aligned} \Rightarrow \text{ar}(\parallel \text{ gm ABCD}) &= 2 \text{ ar}(\Delta APB) \\ &= 2 \times 40 \text{ cm}^2 = 80 \text{ cm}^2 \end{aligned}$$

(ii) Now $\text{ar}(\Delta APQ) : \text{ar}(\Delta PQB) = AQ : QB$

$$\Rightarrow \text{ar}(\Delta APD) : \text{ar}(\Delta BPC) = DP : PC$$

$$\Rightarrow 25 \text{ cm}^2 = 15 \text{ cm}^2 = DP : PC$$

$$\Rightarrow DP : PC = 25 : 15 \quad (\text{Dividing by } 5)$$

$$\Rightarrow DP : PC = 5 : 3 \text{ Ans.}$$

Q. 30. In the given figure, $AB \parallel DC \parallel EF$, $AD \parallel BE$ and $DE \parallel AF$.

Prove that : $\text{ar}(\parallel \text{ gm DEFH})$

$$= \text{ar}(\parallel \text{ gm ABCD}).$$

Sol. Given : In the figure, $AB \parallel DC \parallel EF$, $AD \parallel BE$ and $DE \parallel AF$.

To prove : $\text{ar}(\parallel \text{ gm DEFH})$

$$= \text{ar}(\parallel \text{ gm ABCD})$$

Proof : \parallel gm ABCD and \parallel gm ADGE are on the same base AD and between the same parallels.

$$\therefore \text{ar}(\parallel \text{ gm ABCD}) = \text{ar}(\parallel \text{ gm ADGE}) \quad \dots(i)$$

Similarly \parallel gm DEFH and \parallel gm ADEG are on the same base DE and between the same parallels.

$$\therefore \text{ar}(\parallel \text{ gm DEFH}) = \text{ar}(\parallel \text{ gm ADEG}) \quad \dots(ii)$$

From (i) and (ii)

$$\text{ar}(\parallel \text{ gm ABCD}) = \text{ar}(\parallel \text{ gm DEFH})$$

Hence proved.

Q. 31. In the given figure, squares ABDE and AFGC are drawn on the side AB and hypotenuse AC of right triangle ABC and $BH \perp FG$.

Prove that :

(i) $\Delta EAC \cong \Delta BAF$.

(ii) $\text{ar}(\text{sq. ABDE}) = \text{ar}(\text{rect. ARHF})$.

Sol. Given : Square ABDE and AFGC are drawn on side AB and hypotenuse AC of right triangle ABC. $BH \perp FG$ intersecting AC at R.

To prove : (i) $\Delta EAC \cong \Delta BAF$.

(ii) $\text{ar}(\text{sq. ABDE}) = \text{ar}(\text{rect. ARHF})$.

Construction : Join BF and CE.

Proof : $\angle CAE = \angle CAB + \angle BAE$
 $= \angle CAB + 90^\circ \quad \dots(i)$

$$\begin{aligned}\text{Similarly } \angle BAF &= \angle CAB + \angle CAF \\ &= \angle CAB + 90^\circ \quad \dots(ii)\end{aligned}$$

From (i) and (ii)

$$\angle CAE = \angle BAF$$

(i) Now in $\triangle EAC$ and $\triangle BAF$

$$\angle CAE = \angle BAF \quad (\text{proved})$$

$$AE = AB \quad (\text{sides of a square})$$

$$AC = AF \quad (\text{sides of a square})$$

$$\therefore \triangle EAC \cong \triangle BAF$$

(SAS criterion of congruency)

and $\text{ar}(\triangle EAC) = \text{ar}(\triangle BAF)$

(ii) Square ABDE and $\triangle EAC$ are on the same base AE and between the same parallels.

$$\therefore \text{ar}(\triangle AEC) = \frac{1}{2} \text{ar}(\text{square ABDE})$$

...(iii)

Similarly $\text{ar}(\triangle BAF)$

$$= \frac{1}{2} \text{ar}(\text{rect. ARHF}) \quad \dots(iv)$$

But $\text{ar}(\triangle AEC) = \text{ar}(\triangle BAF)$

(proved)

$$\therefore \frac{1}{2} \text{ar}(\text{sq. ABDE})$$

$$= \frac{1}{2} \text{ar}(\text{rect. ARHF})$$

[from (iii) and (iv)]

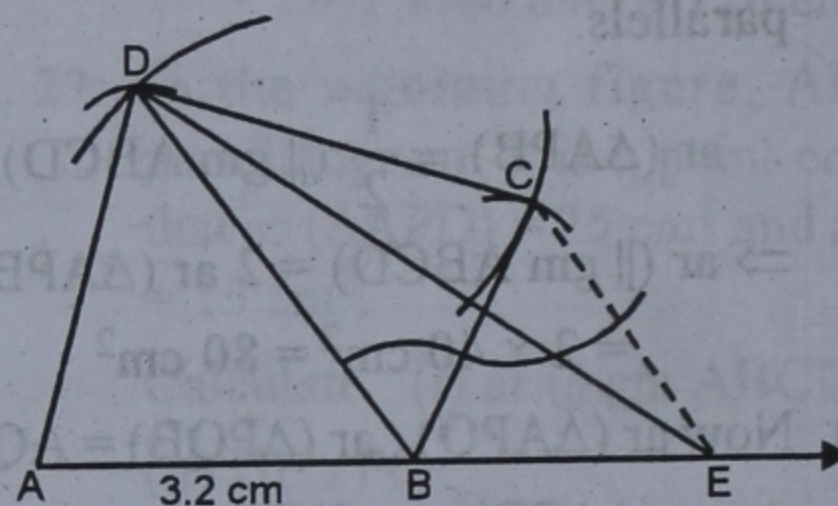

$$\Rightarrow \text{ar}(\text{sq. ABDE}) = \text{ar}(\text{rect. ARHF})$$

Hence proved.

Q. 32. Construct a quadrilateral ABCD in which $AB = 3.2$ cm, $BC = 2.8$ cm, $CD = 4$ cm, $DA = 4.5$ cm and $BD = 5.2$ cm. Also construct a triangle equal in area to this quadrilateral.

Sol. Steps of construction :

- (i) Draw a line segment $AB = 3.2$ cm.
- (ii) With centre A and radius 4.5 cm and with centre B and radius 5.2 cm, draw arcs which intersect each other at D.

(iii) Join AD and BD.

(iv) Again, with centre B and radius 2.8 cm, and with centre D and radius 4 cm, draw two arcs intersecting each other at C.

(v) Join BC and CD.

ABCD is the given quadrilateral.

(vi) Produce AB.

(vii) From C, draw a line parallel to BD meeting AB produced at E.

(viii) Join DE.

Then, $\triangle ADE$ is the required triangle whose area is equal to the area of the quadrilateral ABCD.
